CORRIGENDA

In the paper by H. K. DOONER and J. L. KERMICLE (GENETICS 113: 135-143; May, 1986) entitled "The transposable element *Ds* affects the pattern of intragenic recombination at the *bz* and *R* loci in maize," in Table 2, the genotypes in the first column are inverted with respect to the four "Linked marker composition" columns and also should be designated as single linkage groups with solid rather than twice-interrupted horizontal lines. For instance, the first entry should read

$$\frac{g}{G} \frac{r-m1}{r-r:n46} \frac{M-st}{+}.$$

Two errors appeared in the paper by M. S. JACKSON, D. M. BLACK and G. A. DOVER (GENETICS 120: 1003-1013; December, 1988) entitled "Amplification of *KP* elements associated with the repression of hybrid dysgenesis in *Drosophila melanogaster*." In the heading to Table 4, "Cross 1" should read "Cross 2" and "Cross 2" should read "Cross 1". As a result, the conclusion to the first paragraph on page 1010 should read as follows: "The other 11 Q lines gave significantly more dysgenic ovaries in cross 2 (see Table 3) demonstrating the existence of a maternal component to repression. However, only 3 of these Q lines gave more than 95% dysgenic ovaries in cross 2, all others gave less than 80% suggesting that some of the repression in these lines is transmitted through both sexes."
