CCLVIII. THE ANTISCORBUTIC ACTIVITY OF THE CORTEX OF THE SUPRARENAL GLAND OF THE OX.

By SYLVESTER SOLOMON ZILVA¹.

From the Division of Nutrition, Lister Institute, London.

(Received November 10th, 1932.)

IN connection with an inquiry which has been going on for some months on the question of the identity of hexuronic acid with the antiscorbutic factor, I took the opportunity of testing the cortex of the suprarenal gland of the ox. This as will be seen from Fig. 1 was more active than decitrated lemon

juice tested at the same time and under the same conditions. In view of the fact that Dr L. J. Harris, who was kind enough to show me his detailed results while they were in the press [see also 1932], is independently publishing his experiments on the activity of the cortex of the suprarenal gland, I think it of interest also to record my tests the outcome of which is similar to his.
