PIGEON WATER SUPPLY

Water may be supplied to pigeons in their home cages by means of the inverted bottle and tube arrangement often used with rats. A metal tube of a 6-millimeter diameter, bent at an angle of 120 degrees and inserted through the cork of a 1-pint mason jar, has proved satisfactory. The pigeon inserts its beak into the end of the tube and pumps the water out. If the bird does not find the water at first, a small water cup may be placed at the end of the tube for a short time.
