Levels of genetic polymorphism: marker loci versus quantitative traits

R. K. Butlin and T. Tregenza

Table 1 on p. 193 of this paper includes some erroneous values due to a mistake in a spreadsheet that has been discovered through a re-analysis of the data. The errors do not affect the conclusions drawn in the paper. A correct version of the table follows.

Table 1. χ^2 isolation indices between pairs of European populations of the meadow grasshopper
(Locations of populations are given in figure 2.)

population	1	2	3	4	5	6
1. S. France						
2. S. France	0.067					
3. N. France	−0.122	0.500*				
4. England	0.198	−0.063	0.472*			
5. Spain	−0.088	0.545*	−0.365	0.272		
6. Germany	0.056	0.113	0.189	0.230	0.045	
7. N. Greece	0.380	0.381*	0.527*	0.306*	0.547*	0.499*

*Indicates that the individual isolation index is significantly different from 0 (i.e. departs from random mating) at $p < 0.05$. Positive indices indicate assortative mating.
