EDITOR'S QUIZ: GI SNAPSHOT

An unusual cause of gastric outlet obstruction

Robert Spiller, *Editor*

Clinical presentation

A 55-year-old woman presented with a 1-day history of repeated vomiting of non-bile stained content. She also had intermittent epigastric pain and dizziness for 3 months. She did not have a history of tarry stool or fresh per rectal bleeding. She was pale and abdominal examination showed succession splash and a ballotable right upper quadrant mass. Laboratory tests revealed a haemoglobin level of 4.7 g/dl and an albumin level of 27 g/l. CT of the abdomen was performed (fig 1 A–C).

Question

What is the most likely diagnosis? What are the possible treatments?

See page 1018 for answer

This case is submitted by:
