LETTER TO EDITOR

The Revision of the Article Entitled "A Case of a Cutaneous Angiomyolipoma"

Dear Editor,

We have read the article entitled "A Case of a Cutaneous Angiomyolipoma" by Shin et al¹. The author informs that "This article is the 20th reported case of cutaneous angiomyolipoma and the 3rd reported case in Korea". However, Ko et al² had reported a case of cutaneous angiomyolipoma in Korean Journal of Dermatology and accordingly, the case in the article of Shin et al¹ becomes the 4th reported case in Korea. In addition, the illustration of the figure describing a blue nodule in the left ear does not correspond with the text which describes it as the right ear and should be revised

correctly. It will be very pleasing if we could acquire more accurate and valuable information from Annals of Dermatology in the future.

ERRATUM

In the article by Shin et al¹, abstract, table and references were published incorrectly. The correct version of them are shown below:

Abstract

Cutaneous angiomyolipoma, which is also known as cutaneous angiolipoleiomyoma, is a rare benign mesenchymal tumor. Only 18 cases in the English-language literature have been reported. We describe a case of

angiomyolipoma presenting on the right ear helix of a 26-year-old female. Histopathological examination revealed a typical form of angiomyolipoma, showing a proliferation of mature adipocytes. As with all previously reported cases, our patient did not present with the stigmata of tuberous sclerosis. As far as we know, this is the 22nd reported case of cutaneous angiomyolipoma and the 4th case in Korea.
