Yoo KH, Baik M, Hennighausen L. Context-specific growth hormone signaling through the transcription factor STAT5: implications for the etiology of hepatosteatosi and hepatocellular carcinoma. *Genes Cancer*. 2011;2:3-9. (Original doi: 10.1177/1947601911405046)

In the above article, the membrane-spanning domain of the growth hormone receptor (GHR) shown in Figure 1A and Figure 1B (below left) is depicted incorrectly. The GHR is a dimer formed by two identical polypeptide chains, each of which contains a single transmembrane domain (below right).

Figure 1 - original.

Figure 1 - revised.
