Restriction enzymes and their isoschizomers

Richard J. Roberts and Dana Macelis

Cold Spring Harbor Laboratory, Cold Spring Harbor, NY 11724-2202, USA

INTRODUCTION

Since the last compilation of restriction enzymes, (1) 442 new entries have been added including 13 new specificities. A complete list of these new enzymes can be found in Table I. With the growing size of the restriction enzyme database and the recognition that the most widespread use of the information is as a database for computer programs predicting restriction enzyme cleavage patterns, Table II contains a listing of all prototype restriction enzymes (Types I, II and III) together with their commercially available isoschizomers. It should be noted that an alternative compilation of these enzymes has recently been produced (3).

During the previous year the names of several restriction enzymes have been changed by the original authors.

Old Name	Prototype	Recognition Sequence	New Name
<i>HalB6I</i>	<i>EcoRI</i>	G↓AATTC	<i>HalI</i>
<i>HalB6II</i>	<i>PstI</i>	CTGCA↓G	<i>HalII</i>
<i>NgoAIII</i>	<i>SacII</i>	CCGC↓GG	<i>NgoFIII</i>
<i>NgoAIV</i>	<i>NaeI</i>	G↓CCGGC	<i>NgoFIV</i>
<i>PglB4I</i>	<i>ClaI</i>	AT↓CGAT	<i>PglI</i>
<i>Spil</i>		CCGC	<i>Acil</i>
<i>SsrB6I</i>	<i>HpaI</i>	GTT↓AAC	<i>SsrI</i>
<i>Uba1102I</i>	<i>EspI</i>	GC↓TNAGC	<i>Bpu1102I</i>
<i>Uba1103I</i>	<i>AvaIII</i>	ATGCA↓T	<i>Mph1103I</i>
<i>Uba1103II</i>	<i>DpnI</i>	GATC	<i>Mph1103II</i>
<i>Uba1104I</i>	<i>Ksp632I</i>	CTCTTC (1/5)	<i>Eam1104I</i>
<i>Uba1105I</i>		GACNNN↓NNGTC	<i>Eam1105I</i>
<i>Uba1106I</i>	<i>PpuMI</i>	RGGWCCY	<i>Mlu1106I</i>
<i>Uba1108I</i>		TCGTAG	<i>Pfl1108I</i>
<i>Uba1I</i>	<i>PpuMI</i>	RG↓GWCCY	<i>Pf27I</i>

The complete database is available in many formats including the styles shown in Tables I and II, or as a flat file arranged in fields that can easily be reformatted. It is possible to get regular monthly updates or specialized versions of the database by electronic mail. For instance, files containing the database in formats that can be used directly by the UWGCG, IGSuite and other computer software packages are available. Anyone who wishes to be included on the electronic mailing list for these regular monthly updates should send a request to roberts@cshl.org by e-mail.

In forming Table I all endonucleases cleaving DNA at a specific sequence have been considered to be restriction enzymes, although in most cases there is no direct genetic evidence for the presence of a restriction modification system. The endonucleases are named in accordance with the proposal of Smith and Nathans (4).

ACKNOWLEDGMENTS

Special thanks are due to the many individuals who have so kindly communicated their unpublished results for inclusion in this compilation. Work from the authors' laboratory is supported by the N.I.H. (GM40537).

FOOTNOTES

1. When two enzymes recognize the same sequence, i.e., are isoschizomers, the prototype (i.e., the first example isolated) is indicated in parentheses.
2. Recognition sequences are written from 5' → 3', only one strand being given, and the point of cleavage is indicated by an arrow (↑). When no arrow appears, the precise cleavage site has not been determined. For example, C↑GATCG is an abbreviation for
5' C↑G A T C G 3'
3' G C T A G ↑C 5'

For enzymes such as *SapI* and *AcI*, which cleave away from their recognition sequences, the sites of cleavage are indicated in parentheses. For example *SapI* GCTCTTC(1/4) indicates cleavage as shown below

AcI CCGC(-2/-2) indicates cleavage as shown below

In all cases the recognition sequences are oriented so that the cleavage sites lie on their 3' side.

* A is N⁶-methyladenosine.

3. These columns indicate the frequency of cleavage by the various specific endonucleases on bacteriophage lambda DNA (λ), adenovirus-2 DNA (Ad2), simian virus 40 DNA (SV40), φX174 Rf DNA and pBR322 DNA (pBR). In all cases the sites were derived by computer search of the complete sequences obtained from GENBANK.

FOOTNOTES

- * signifies that *Dpn*I and its isoschizomers require the presence of 6-methyladenosine within the recognition sequence GATC.
- Recognition sequences are given using the standard abbreviations (Eur. J. Biochem. 150: 1-5, 1985) to represent ambiguity:
 - R = G or A
 - Y = C or T
 - M = A or C
 - K = G or T
 - S = G or C
 - W = A or T
 - H = A or C or T
 - B = G or T or C
 - V = G or C or A
 - D = G or A or T
 - N = A or C or G or T
- The site of methylation by the cognate methylase when known is indicated as follows. The first number shows the base within the recognition sequence that is modified. A negative number indicates the complementary strand, numbered from the 5' base of that strand. The number in parentheses indicates the specific methylation involved. (6) = N6-methyladenosine; (5) = 5-methylcytosine; (4) = N4-methylcytosine.
- Commercial sources of restriction enzymes are abbreviated as follows:
 - A Amersham (2/91)
 - B BRL (2/91)
 - D Palliard Chemical (11/90)
 - E Stratagene (2/91)
 - F ESP Fermentas (9/90)
 - G BioExcellence (formerly Anglian) (11/90)
 - H American Allied (12/90)
 - I IBI (2/91)
 - J Janssen Biochimica (2/91)

- K Takara (1/91)
- L Northumbria Biologicals Ltd. (9/90)
- M Boehringer Mannheim (2/91)
- N New England Biolabs (2/91)
- O Toyobo (2/91)
- P PL-Pharmacia-LKB (2/91)
- Q Molecular Biology Resources (1/91)
- R Promega Biotec (12/90)
- S Sigma (2/91)
- U USB (9/90)
- V Serva (2/91)
- X New York Biolabs (2/91)

5. *BcgI*⁵ cleaves on both sides of the recognition sequence: 10 bases 5' to the recognition sequence and 12 bases 3' to it on both strands. Thus the recognition site is excised in a fragment, 34 base pairs long, with 2-base 3'-extensions at each end.
6. *EcoRII* isoschizomers fall into two classes based upon their sensitivity to methylation. *EcoRII* will not cleave when the second cytosine in the recognition sequence is methylated to 5-methylcytosine whereas *MvaI* will cleave such a sequence. Isoschizomers of *EcoRII* that are like *MvaI* are indicated by +.
7. *MboI* isoschizomers fall into two classes based upon their sensitivity to methylation. *MboI* will not cleave when the recognition sequence contains 6-methyladenosine whereas *Sau3AI* will not cleave when its recognition sequence contains 5-methylcytosine. Isoschizomers of *MboI* that are like *Sau3AI* are indicated by +.
8. *TaqII* differs from other restriction enzymes in recognizing two distinct sequences: GACCG and CACCCA.
