Submitted September 26, 1990

EMBL accession no. X52681

The gene coding for the *Pvu* II restriction enzyme was isolated by screening pools of pBR322 for the presence of enzyme activity. We present its complete nucleotide sequence which contains an open reading frame of 157 amino acids. The approximate molecular weight of 18kDa is in good agreement with SDS-PAGE determined molecular weight of the protein. The location of the open reading frame is consistent with deletion analysis data (1). Computer-predicted promoter sequences are underlined, the Shine-Dalgarno signal is doubly underlined. The presented sequence overlaps partially with the methylase gene recently published (2). The region upstream of the *Pvu* II-R gene contains also the promoter elements for the methylase gene which is transcribed in the opposite direction (1). No homology between the *Pvu* II-R gene sequence and other known restriction enzyme sequences was found.

ACKNOWLEDGEMENTS

We thank Prof. V. Bouriotis for his valuable suggestions and the Enzyme Technology Group of IMBB for their technical assistance.
