ABSTRACT

A list of DNA sequences cloned from the human genome is presented. Intended as a guide to clone availability, this list includes published reports of cDNA, genomic and synthetic clones comprising gene and pseudogene sequences, uncharacterised DNA segments and repetitive DNA elements.

INTRODUCTION

We present here an updated compilation of reports describing the cloning of DNA sequences from the human genome. The list now contains over 4000 independent reports of cDNA, genomic and synthetic clones comprising genes, pseudogene sequences, uncharacterised DNA segments and repetitive DNA elements. Reports published before 6.1.88 are logged under the name of the first author. Compilation is manual since it has proved to be the most efficient and rapid means of collating these data. In excess of 150 journals and periodicals are regularly scanned for reports describing human gene cloning.

The present total number of reports logged represents an increase of more than 1000 entries since the list was last published[1] and there is every indication that this rate of inclusion will be maintained. The rate of inclusion of entries since 1977, when the first human DNA sequence was cloned, is shown in the figure. Also shown year by year are the numbers of genes which have been cloned for the first time. It can be seen that the rate of cloning of novel sequences reflects the overall increase in the number of cloning reports. Altogether, in excess of 1000 different protein-coding sequences have now been cloned from the human genome.

As in the previous compilation, published reports describing the cloning of uncharacterised DNA segments continue to be included. Further information

Rate of cloning of human DNA sequences

- ☐ Cumulative annual number of reports detailing the cloning of human DNA sequences
- ☒ Cumulative annual number of reports detailing the novel cloning of human protein-coding genes

on specific anonymous DNA segments is to be found in the Human Gene Mapping 8[2] and 9[3] reports.

This list will continue to be published annually in the April Supplement of Nucleic Acids Research. It will also continue to be made available as an updated computer print-out ('Gene Communications') which is distributed quarterly for a small handling charge. Gene Communications is also available as a dbase II file on an IBM PC-formatted floppy disc.

We are most grateful to those who have submitted additions and corrections since this has helped to keep the list as accurate and complete as possible. We hope that the provision of the list will not only serve as a useful guide to clone availability but will also encourage the transfer of cloned DNA sequences between laboratories.
