Dear Sir,

Herewith sending a small poem on a disease of breast known as 'Fibroadenoma'. This poem describes the definition, clinical symptoms, and pathology of fibroadenoma. I hope the specialists and students of surgery would appreciate this effort and may even include as a unique teaching material for medical students. I think this Innovative idea will inspire a lot of students.

Fibroadenoma

Tumour common, malignant, which is not,
Predilection for 15–30 years, which has got.

Solitary, encapsulated and small,
Discoid or spherical like a ball.

Large, of 15 cm. Diameter are also seen,
Giant Fibroadenomas named they have been.

Tissues fibrous, mainly, find you do,
Relation with ducts produces patterns two.

Intracanalicular-slit like clefts does show,
Or cords of epithelium, around stroma grow.

In Pericanalicular, masses fibrous are found,
Encircling ducts-dilated, patent and round.

More are acini and scanty is stroma,
Give it the name Tubular Adenoma.

To this, secretory activity you add,
Then Lactating Adenoma can be had.

Rapidly growing mass, also large in size,
Call it Juvenile Fibroadenoma, men wise.
