Abstract

The Technology Portal of the Protein Structure Initiative Structural Biology Knowledgebase (PSI SBKB; <http://technology.sbkb.org/portal/>) is a web resource providing information about methods and tools that can be used to relieve bottlenecks in many areas of protein production and structural biology research. Several useful features are available on the web site, including multiple ways to search the database of over 250 technological advances, a link to videos of methods on YouTube, and access to a technology forum where scientists can connect, ask questions, get news, and develop collaborations. The Technology Portal is a component of the PSI SBKB (<http://sbkb.org>), which presents integrated genomic, structural, and functional information for all protein sequence targets selected by the Protein Structure Initiative. Created in collaboration with the Nature Publishing Group, the SBKB offers an array of resources for structural biologists, such as a research library, editorials about new research advances, a featured biological system each month, and a Functional Sleuth for searching protein structures of unknown function. An overview of the various features and examples of user searches highlight the information, tools, and avenues for scientific interaction available through the Technology Portal.

Keywords

Database; Protein; Protein Production; Structural Biology; Structural Genomics; Technology

Introduction

The Protein Structure Initiative began in 2000 and during the first two phases of the initiative, PSI-1 and PSI-2 Centers focused on rapidly determining protein structures on a genomic scale and developed many tools and technologies for this purpose [1]. The Structural Genomics Knowledgebase was established in 2008 to provide a centralized access point for data and technological information garnered from the PSI effort. The Knowledgebase combined these advances with publicly available resources to become a comprehensive web resource intended to enable biological research [2]. Shortly after its inception, the Knowledgebase entered into collaboration with the Nature Publishing Group to become a gateway site to deliver editorial content as well as provide access to the PSI

Corresponding author Lida K. Gifford, lkifford@lbl.gov, Lawrence Berkeley Laboratory, 1 Cyclotron Road, MS 64R0121, Berkeley, CA 94720, USA.

data and public resources. At the beginning of third phase of the initiative, PSI:Biology, the website changed its name to the Structural Biology Knowledgebase (SBKB; <http://sbkb.org>). The SBKB continues to offer an array of resources for structural biologists, such as a research library, structural biology updates, a featured biological system each month, and a Functional Sleuth for searching protein structures of unknown function.

The SBKB is also a portal of portals, providing access to discreet websites dedicated to experimental data tracking, protocols, materials, annotation, modeling, PSI publications, and technology [1]. The PSI SBKB Technology Portal (<http://technology.sbkb.org/portal>) was established during the second phase of the initiative and functions as a repository for the technological developments catalyzed by all stages of the PSI program. This web resource is comprised of over 250 tools and technology summaries representing each step of the protein structure determination pipeline, the majority of which have been developed by the PSI and are in use at PSI Centers. In addition, the Technology Portal functions as a conduit for communicating technological advances to researchers at PSI Centers and the wider scientific community, creating opportunities for collaboration among scientists. Recently, the Technology Portal home page was redesigned to present all features in one easy-to-navigate page. In this article, we will describe the features of the Technology Portal, such as searching the technology pages and accessing the online resources in the Technology Toolbox, which can be used to enable structural biological research.

Navigating the Technology Portal

The Technology Portal can be reached directly (<http://technology.sbkb.org/portal/>) or by visiting the SBKB (<http://sbkb.org>), selecting the Methods Hub, and clicking on the Tech Portal link. In addition, information from the portal can be accessed via the SBKB using a keyword search. Once at the Tech Portal, users can access all of the technology pages and online resources through the homepage. Following is a full description of the homepage content and functionalities (Figure 1).

Architecture of the Technology Portal—The Technology Portal website is hosted using Apache HTTP Server software [3]. This web resource is constructed using Django 1.2, a Python-based web framework [4] that queries the data stored in a SQLite database [5] and displays these data as technology pages. The open source software package, Django, has pre-developed tools for site administration and provides a user interface for managing database information content, such as entering new technologies, uploading figures, and editing existing records.

Searching the Technology Portal—The Technology Portal homepage offers two ways to search the technology pages: plain text and by experimental stage (Figure 2a). A text search of two or more words will automatically perform an AND search; placing terms in quotation marks will produce results where the words are adjacent in the text. Entering text in the search box will perform a search of all technology pages and return a list of results with the most recently edited pages listed first, prioritizing technology pages containing the newest information. Each technology is indexed by experimental stage, so querying by individual stage in the protein structure determination process can be used when a more general search is desired. The experimental steps currently indexed on the Technology Portal are: Target Selection, Reagents, Cloning, Protein Expression, Purification, Crystallography, NMR, Function/Annotation, Modeling, and Dissemination Tools. Selecting one of these categories from a drop-down menu will return an alphabetical listing of all records tagged for that particular process (Figure 2b). The user can browse the list of returned items containing a title and summary of each technology page and a link to the full article. Once the desired article is located, the user can click the “More” link to get a

technology page that contains a description of the technology, figures, and information regarding publication, whom to contact, web links, and availability, if applicable (Figure 2c).

Exploring the Technology Toolbox

Featured Technology: The Featured Technology highlight is periodically updated and focuses on technologies of interest to structural biologists. This section has been used to increase awareness of a variety of specific PSI Center-developed technologies; Biosync, a widely used X-ray crystallography web resource (<http://biosync.sbk.org>) [6]; and the many robotic and automation techniques in use at two of the PSI Membrane Centers, NYCOMPS and TEMIMPS.

Web-Related Resources: The Web-Related Resources section allows the user to browse a list of technology pages describing web servers or web-based tools that can be employed by structural biologists to design, predict, and model results. Over 50 technology pages detail and provide links to online tools for designing [7, 8] and predicting experimental results [9–12], comparing and annotating protein structures [13, 14] [15–17], ligand binding and searching [18, 19], modeling [20–22], data analysis and management [23–27], and more. This list includes technology pages detailing databases for designing experiments [9], modeling [20, 21], and determining function [28, 29], as well as the PSI High-Throughput Center structure galleries [30–34].

Technology Websites: All four of the PSI:Biological High-Throughput Centers for Protein Structure Determination maintain web pages describing the software, tools, and other technologies they have developed to relieve bottlenecks in protein structure determination. In addition, over half of the Centers for Membrane Protein Structure Determination include technology and methods pages on their websites that describe advances in expressing, purifying, screening, and determining structures of membrane proteins. Clicking on the link in this portion of the Toolbox returns a complete list of the technology links on PSI Center websites, allowing for easy access to more information and the opportunity to browse the technologies in the context of the full scope of distinct high-capacity structure determination projects.

Technology Videos: The PSI SBKB Technology Portal has established a channel on YouTube (<http://www.youtube.com/user/sbktech>) to house videos of technologies related to various stages of high-throughput protein structure determination. Presently, there is a movie of a large-scale fermenter in action [35], as well as narrated demonstrations of technical advances in crystallography [36–38] and NMR [7].

Social Networking: The Technology Portal has several opportunities for social networking. The PSI SBKB Technology Portal Forum group (http://network.nature.com/groups/psikb_tech/) is hosted on the Nature Network. This forum provides a place for users of the Portal to connect on a professional level, get more information, receive email updates of technology posts and to ask the community questions about structural biology technology. The PSI SBKB Technology Portal recently established a Facebook page (<http://www.facebook.com/pages/PSI-SBKB-Technology-Portal/209476552428114?sk=wall>). This web page allows for the Technology Portal to communicate information about new content or other changes to the website directly to users who have “liked” the page. Participation in these social outlets makes it possible to establish a line of communication with users who have indicated interest in learning more about technologies that can be useful in their research.

In addition to these opportunities for information transfer, all technology pages can be posted to social networking accounts on Facebook, LinkedIn, and Twitter, allowing scientists to share what they think is interesting with their friends and colleagues directly from the Technology Portal. The pages can be bookmarked on Google and del.icio.us for easy access from the browser at a later date and each page can be shared or recommended to a wider audience on stumbleupon, reddit and digg it.

Menus—The homepage has two menus on the left-hand side that are accessible to the users regardless of which page they are viewing: the Main Menu and the PSI SBKB Menu (Figure 1 *a* and *d*). The links in the Main Menu provide an easy way to quickly navigate back to the home page or access the Technology Toolbox pages from anywhere in the website. Another handy feature of the Main Menu is the text search box that can be used to perform a quick keyword search from any page of the website. The PSI:Biological Network link allows users to peruse the list of PSI:Biological centers and structural biology partnerships and link to their landing pages housed on the SBKB.

The PSI SBKB Menu is similarly available and gives users the ability to hop to the SBKB for further information or tools. Once at the PSI SBKB, the user can still access information in the Technology Portal by performing a keyword search on the SBKB homepage.

Synergy with other PSI:Biological Resources

The Technology Portal works closely with two other PSI:Biological web resources by using link-outs to connect useful information between sites. The first collaboration was established with the PSI Publications Portal (<http://olenka.med.virginia.edu/psi/>), which contains all publication information and statistics for the more than 1600 peer-reviewed articles that have been published by the PSI over the past 10 years [1]. If a publication listed on a technology page can be found in the PSI Publications Portal, the user has the opportunity to click on a link to search that website for further information about the reference. Reciprocally, all descriptions of articles in the Publications Portal referenced by the Technology Portal contain a link to the appropriate technology page. This allows users to access more information about a given technology quickly and easily directly from the Publications Portal.

Crosslinks have also been established with the other PSI Resource Center, the PSI:Biological-Materials Repository (PSI-MR, <http://psimr.asu.edu/>) [39, 40]. The PSI-MR stores, maintains, and distributes PSI-created protein expression plasmids and vectors. As of October 2011, the Materials Repository has over 50,000 PSI plasmids and 85 empty vectors available for distribution. Several of the technology pages are dedicated to describing the different types of vectors designed and used by PSI Centers [41–47]. Each one of those pages informs users that the materials are available from the PSI-MR and provides users with a link to the page that describes these empty vectors in more detail or takes them directly to an order page. In addition, at several points on the Empty Vectors page (<http://psimr.asu.edu/EmptyVectors.html>), the PSI-MR directs the user to the Technology Portal for more information and provides a link to the appropriate technology page.

Conclusion

The Technology Portal is a resource dedicated to capturing and highlighting technological advances that are instrumental to enabling structural biological research. This is accomplished by maintaining a dynamic web site, interacting with PSI Centers and members of the wider scientific community, and using the web portal to disseminate knowledge and provide tools scientists can take and use in their research. We welcome feedback from the community at psi-tech@lbl.gov.

Acknowledgments

The authors would like to thank the Protein Structure Initiative PIs, researchers, and Structural Biology Knowledgebase members for their collaboration and support of the Technology Portal. We thank Ralf Grosse-Kunstleve for server maintenance and technical support and Jeffrey Headd for helpful discussions. The Technology Portal is a resource center within the Protein Structure Initiative and is supported by grant U01GM093324 from the National Institute of General Medical Sciences. This work was supported in part by the US Department of Energy under Contract No. DE-AC02-05CH11231.

Article Summary

The Technology Portal of the Protein Structure Initiative Structural Biology Knowledgebase is a web resource designed to provide methods and tools that can be employed to relieve bottlenecks in many areas of structural biology research. Several useful features are available on the web site, including multiple ways to search the database of over 250 technological advances, links to online resources, access to videos of methods on YouTube, and avenues for networking with fellow scientists.

Figure 1.

The PSI SBKB Technology Portal home page. The access point to the website has several useful features (clockwise from the top left): **a** Main menu containing links to the main features of the portal and a quick keyword search box; **b** Search area allowing users to access information by keyword or experimental step; **c** the Technology Toolbox, containing a dynamic article on a Featured Technology, and links to Web-Based Resources, Technology Pages, the Technology Portal YouTube channel, and the Technology Forum group hosted by the Nature Network; **d** the PSI SBKB main menu linking users directly to myriad resources that are encompassed by the SBKB. The Main Menu and PSI SBKB Menus are static and show up on all pages to allow users a shortcut to other information in the Technology Portal or SBKB.

Summary
The effect of detergents on the surface tension of water is used to measure the concentration of the detergent in the solution. Alternative hardware and software solutions for making the measurement are available within the TEMIMPS consortium.

Description
Knowledge of the detergent concentration is critical for optimizing 2D crystallization. The concentration can be measured using the DropBox, a device that determines the contact angle of a drop deposited on Parafilm as described in Kaufmann et al. As an alternative setup, a commercial camera with a macro lens can be used to record pictures of the drop.
In practice, a small drop (20µl) of the sample is pipetted onto a Parafilm-coated substrate. The drop is allowed to equilibrate for 30-60 s, and thereafter imaged with a digital camera. The profile of the drop is fitted with an ellipse, which is used to calculate the contact angle with the substrate. By comparison to drops with known detergent concentrations, it is possible to determine the amount of detergent in the sample. Software solutions available for shape measurement include the software developed with the DropBox by Kaufmann et al., a python-based program called "Xtrace Drop", and a Matlab-based program called "Drop Shape Analysis for Detergent Concentration". TEMIMPS website also can be consulted for more details.

Figure

Picture of a drop before and after tracing its profile and determining the contact angle with the substrate. The red line shows the baseline of the substrate. The green circle shows the ellipse fitted to the drop. The yellow dotted lines show the width and height of the ellipse and pink lines show the contact angle. For this drop, width to height ratio has been measured at 1.46 and contact angles at 64.8 degrees.
