Figure 1.
A 48-year-old male presented with a central corneal ulcer after trauma with a metal wire. The organism was identified as a filamentous fungus consistent with *Rhizopus* species. Patient was started on oral and topical voriconazole and later underwent an optical keratoplasty.

Figure 2.

A, Photo shows a hematoxylin-eosin section examined under fluorescent microscope. The fungus reveals an exquisite pattern of autofluorescence. B, Microscopic examination shows multiple branching nonseptate hyphae (hematoxylin-eosin, original magnification x200).
