Erratum

The April 1, 2017, article by Sledge et al, entitled “Put Some PEPI in Your Step: Ki67’s Long Road to Respectability” (J Clin Oncol 35:1031-1032, 2017), was published with errors.

The final sentence of the seventh paragraph read “The Ki67 measurement was then included in the PEPI algorithm and used to evaluate benefit.” Instead, it should have read “The Ki67 measurement was **also** included in the PEPI algorithm and used to evaluate **prognosis after surgery**.”

Also, the first sentence of the ninth paragraph read “Z1031B made the next logical leap, giving standard chemotherapy to patients with a high PEPI score.” Instead, it should have read “Z1031B made the next logical leap, giving standard

chemotherapy to **patients in whom the two- to four-week biopsy showed a Ki67 value above 10%.**”

Lastly, the second sentence of the ninth paragraph read “This made perfect sense, with anatomy and biology suggesting both the need for and likely benefit from chemotherapy.” Instead, it should have read “This made perfect sense, **as in their modeling studies these patients were almost never in the PEPI-0 group and therefore eligible to be spared chemotherapy.**”

The online version has been corrected in departure from the print. The author apologizes for the errors.
